Saturday 14.11.26: recording round 2, checklist

For Emranul and Marshal. Tick each box. Stop and ask Claude when anything looks different from what is written. Always: motors off before anyone touches the arm; never push on a held arm; only one program connected to the robot.

Time: about 8 hours for all 58 episodes (5.8 minutes per episode as in round 1, plus changing 32 sheets; the sheet changes are a guess). With 6 hours expect about 40.

1. Before switching on (about 15 minutes)

[ ] Only one program will talk to the robot: close Niryo Studio, camera viewers and every other robot script.

[ ] The robot stands where it stood on 12.11, away from the table edge. Camera and focus ring are not touched.

[ ] Robot on. Only the automatic calibration, never the manual one.

[ ] On the table, outside the camera's view: the folder with the 32 grey track pages (list page in front), the six original sheets, the red puck, a ruler, light-coloured masking tape, a pen, this page and the rules page.

[ ] Both have read the rules page once.

2. Tape the start mark once (about 15 minutes, motors off, arm parked)

[ ] Follow the page "Table marks" (Claude sends it again): a DIRECTION LINE pointing straight away from the robot, 1.5 cm right of the middle of the base's front edge, and a CROSS LINE square to it, 19.5 cm in front of the base axis (about 10.1 cm in front of the base's front edge: measure the edge once).

[ ] One change from that page: use LIGHT masking tape with a thin pen line, not dark tape. The camera sees the table beside the paper, and a dark stripe could become something the model learns. [Claude's judgement, not tested.]

[ ] The crossing of the two lines is the NEW-TRACK MARK. It is only for the new tracks; the six course sheets are laid as before.

3. Open the recording page

[ ] Ask Claude to open it, or type this one line in PowerShell: D:/AI_Project/.venv/Scripts/python.exe D:/AI_Project/.claude/worktrees/training-analysis/02_code/recording_page.py

[ ] The page opens in the browser as before. It lists the six old sheets and the 32 new ones (for example "T01 gentle S-curves, solid"). It offers the next episode by itself, one sheet at a time.

[ ] Keep this program running all day. Close it with Ctrl-C only when no recording runs.

4. The first episode is a watched one (about 10 minutes)

[ ] Sheet T01 solid, plan 11-01, operator Emranul. Lay the sheet as the set-up picture on the page shows: the round start of the line on the mark, the first straight piece along the direction line. Tape the corners.

[ ] New since yesterday: the lift off the puck and the last move down run at 90 % instead of 20 %. Watch them with a hand near the stop button. The last move down must end about 5 mm above the paper.

[ ] After the episode, read the camera-check line in the terminal ("px from the reference"). Above 4 px: tell Claude before the next episode; the taped camera may have moved.

[ ] If the faster moves look wrong: stop, tell Claude. One setting brings back the old speed.

5. The pilot: eight episodes (about 1 hour)

[ ] T01 to T04 on the solid prints, each recorded once by Emranul (plan 1) and once by Marshal (plan 2). The sheet stays taped while you change places. Set the Operator box yourself; the page does

not switch it.

[ ] Use the rules page for every episode: middle of the line, push from behind, cover the end completely, h in the replay when the puck slips.

[ ] After the eight: each of you says for every rule: easy, hard, or not possible. Send it to Claude. Rules may change here, before the rest of the day.

6. The rest of the day, sheet by sheet

[ ] Take the next sheet the page offers, lay it on the mark, tape it, record all its episodes, then put the sheet back into the folder in its place before taking the next one.

[ ] Check on the screen that the sheet on the table is the one in the set-up picture.

[ ] The two pop-up boxes after each episode stay (you asked for them): click OK, then score the episode. Score strictly, as the rules page says.

[ ] A break is possible between two episodes, never inside one. Before a break: motors off, arm parked by hand.

[ ] What does not get done today stays open on the page and is recorded another day; nothing is lost.

7. At the end

[ ] Motors off before the arm is parked by hand. Robot off.

[ ] Close the recording page with Ctrl-C in its window (only when no recording runs).

[ ] Tell Claude "recording done" and how many episodes, and anything that looked different from this page.

Not yet tried at the real robot: the new tracks in the page, the 90 % moves, the faster page. That is why the first episode is watched.
